

Revolution Network

Decentralized Execution Layer for Web, Data & AI Workloads

Turning idle bandwidth and compute into a global execution network — the missing infrastructure layer between AI, data, and the web.

The Problem: Infrastructure Is Broken

Expensive

Web automation, scraping APIs, and proxy networks carry prohibitive per-request costs at scale.

Centralized

Existing solutions rely on centralized clusters – single points of failure, regional limits, and hard scaling ceilings.

Fragmented

AI workflows, automation pipelines, and data extraction tools exist in silos with no unified orchestration layer.

Result: high cost + poor scalability + no unified execution primitive for distributed workloads.

The Solution: A Unified Execution Layer

Revolution Network aggregates global bandwidth and compute into a single programmable API — purpose-built for real-world distributed workloads.

Distributed Job Execution

Run automation and compute tasks across a global mesh of nodes — no fixed infra required.

Bandwidth + Compute Aggregation

Pool idle resources from network participants into elastic, on-demand execution capacity.

AI-Enhanced Task Routing

Intelligent orchestration routes jobs to optimal nodes based on latency, load, and task type.

Scalable Automation Pipelines

Deploy extraction, transformation, and orchestration workflows globally — without bottlenecks.

Architecture: Hybrid Execution Stack

Fully Modular by Design

Each layer operates independently and can be upgraded without disrupting the stack – enabling rapid iteration and partner integration.

● DePIN Layer

Nodes, bandwidth, and lightweight compute contributed by network participants.

● Orchestration Layer

Intelligent routing, job queueing, and fault-tolerant reliability guarantees.

● AI Layer

Pluggable LLM integration (Grok and external APIs) for AI-assisted task execution.

What Runs on the Network

Revolution Network is built for the workloads that modern infrastructure struggles to serve at scale.

Web Scraping

Distributed HTTP automation across global IPs – no proxy bottlenecks.

Data Extraction

Structured extraction pipelines that scale without centralized compute cost.

AI Processing

Content transformation and AI-assisted tasks routed to optimal nodes + LLM APIs.

API Orchestration

Complex multi-step API workflows executed reliably at distributed scale.

Performance: Stress-Tested & Proven

Early-stage benchmarks validate the core execution engine under real concurrent load – results speak for themselves.

60+

Concurrent Jobs

Tested simultaneously with zero system crashes.

88%

Success Rate

At early stage – improving rapidly with each iteration.

~3s

Avg Latency

Stable response times sustained under continuous load.

0

System Crashes

No timeouts or failures during peak stress testing.

✓ Proven distributed execution capability – reliability established before scaling, not after.

Market Opportunity

Where Four Markets Converge

Revolution Network doesn't compete in a single vertical – it sits at the intersection of four rapidly expanding infrastructure categories.

- **Web scraping infrastructure** – a multi-billion dollar industry with no decentralized alternative
- **Automation APIs** – Zapier-like ecosystems hungry for reliable execution backends
- **DePIN compute** – emerging category with proven token incentive mechanics
- **AI data pipelines** – fastest-growing infrastructure demand in enterprise tech

❏ No single competitor addresses all four simultaneously.

Business Model

Multiple revenue streams across execution, infrastructure, and marketplace layers — designed to scale with network growth.

1

Pay-Per-Execution API

Usage-based pricing for job execution — aligns cost directly with value delivered.

2

Enterprise Workload Routing

Premium SLA tiers for enterprise clients requiring guaranteed latency and reliability.

3

Node Bandwidth Incentives

Token-based rewards drive supply-side growth — idle compute becomes productive infrastructure.

4

Marketplace + White-Label

Future: execution node marketplace and white-label infrastructure licensing for large-scale partners.

Competitive Advantage

Others Are Narrow

- VPN-only DePIN networks — bandwidth without execution
- GPU-only compute networks — heavy compute, no web workloads
- Static API providers — centralized, brittle, expensive at scale

We Are General-Purpose

Revolution Network is the only **general-purpose execution network** designed for real-world web, data, and AI workloads — elastic, decentralized, and modular by design.

For enterprise infrastructure players like Bright Data or AWS-adjacent providers, this is not competition — it is an **execution expansion layer** for their existing stack.

Vision: The Execution Layer of the Decentralized Internet

We are building the infrastructure primitive that makes distributed execution as accessible as cloud storage or DNS.

Any Idle Machine Contributes

Every connected device becomes a potential execution node — supply scales with the internet itself.

Any Company Deploys Globally

Enterprises access distributed execution capacity on demand — no infra investment, no regional lock-in.

Execution Becomes a Primitive

Like bandwidth or storage before it, distributed execution becomes a foundational layer of the internet stack.

"The missing execution layer between AI, data, and the web."
